V2 Test Company

Application: Backend Engineer (V2 TEST)

Dear Hiring Manager,

I am applying for the engineering position advertised by your company. My background in developing services, integrating cloud APIs, running performance benchmarks, and building software in Python aligns well with the core responsibilities of this role.

In my previous API work, I was responsible for integrating a serverless API using AWS API Gateway and AWS Services. Alongside API integration, I have built web and mobile applications for clients where I performed performance benchmarks, ensured high availability and security, and used modern technologies to construct automation pipelines for building and deploying web applications.

My background also includes migrating services and working with Python. Specifically, I participated in migrating machine-generated article descriptions from Toolforge to Liftwing, which ensured the smooth and efficient operation of article-description inference services. Additionally, matching your interest in Python skills, I designed a Python-based GUI Decision Support System for Risk-Based Water Quality Guidelines that improved user accessibility and interaction.

I am drawn to your company because the opportunity to build and run payment APIs while improving API performance and migrating services to the cloud directly connects to the engineering challenges I enjoy solving. I would welcome a conversation to discuss how my API and cloud migration experience can support your engineering goals.

Kind regards,

Kenny Chirombo
