Unnamed client (via CareerJunction)

Application: Machine Learning Engineer (Intermediate / Senior)

Dear Hiring Manager,

I am writing to apply for the Machine Learning Engineer (Intermediate / Senior) role. I am a strong match for this position because my background combines deploying real-time machine learning pipelines at scale, integrating large language models into production systems, and maintaining continuous integration, delivery, and testing workflows on AWS SageMaker.

In my prior work, I developed and deployed AI and machine learning models at scale, focusing on automating production workloads, monitoring performance, and maintaining machine learning pipelines for real-time applications. Furthermore, I integrated large language models and advanced machine learning algorithms into production systems, optimizing those models for real-time deployment to improve decision-making and automation for client systems.

To manage model deployment reliably, I used AWS SageMaker to implement and maintain continuous integration, delivery, and testing workflows for machine learning models. This hands-on work with automated testing and delivery workflows prepares me to support your MLOps practices and AWS-based cloud infrastructure for AI applications.

I am drawn to your client's focus on building production machine learning solutions, AI-powered applications, and intelligent agents while supporting deployment into an AI marketplace environment. I would welcome a conversation to discuss how my background in machine learning pipelines and AWS SageMaker workflows can contribute to your team.

Kind regards,

Kenny Chirombo
