Data & Analytics Solutions provider (via CareerJunction)

Application: Full Stack Software Engineer (Python, C#, React)

Dear Hiring Manager,

I am writing to apply for the onsite Full Stack Software Engineer position in Johannesburg advertised through CareerJunction. My background building secure web applications, designing Python-based software, and integrating serverless APIs on AWS fits your requirements for developing, integrating, and deploying software applications.

In my software development work, I built web applications and mobile applications for clients, performing performance benchmarks and ensuring both high availability and security across those client systems. To support application delivery, I also used modern technologies to build automation pipelines dedicated to building and deploying those web applications.

On the cloud and systems integration side, I was responsible for integrating a serverless API with AWS API Gateway and AWS services, matching your stated requirement for API integration and major cloud platform experience. Additionally, I designed a Python-based GUI Decision Support System for Risk-Based Water Quality Guidelines, which improved user accessibility and interaction.

Working with a provider of Data & Analytics Solutions appeals to me because the role brings together frontend and backend development, systems integration, and cloud deployment for web and enterprise systems. I would welcome a conversation to discuss how my experience with web development, Python, and AWS can support your software engineering projects in Johannesburg.

Kind regards,

Kenny Chirombo
